Subcluster proportions across samples | % of parent lineage | all-sample clustering

41 subtypes · 7 lineages · 10 samples · 7 patients · Endothelial excluded; Epithelial retained

Within-parent % = subtype cells / all retained cells of the same lineage in the same sample × 100.
Numbers are percentages (0–100), rounded to one decimal; exact values and parent counts are provided in the Excel workbook.
Only NR_R-complete samples; R = shrinkage >=40%. Grey = missing clinical data or parent absent. Repeated patients share a colour.
