Subcluster proportions across samples | row Z-score | NR vs R

41 subtypes · 7 lineages · 10 samples · 7 patients · Endothelial excluded; Epithelial retained

Within-parent % = subtype cells / all retained cells of the same lineage in the same sample × 100.
Z-scores use the retained 10-sample mean and sample SD within each subtype; missing values are omitted. Not within-group scaling.
Only NR_R-complete samples; R = shrinkage >=40%. Grey = missing clinical data or parent absent. Repeated patients share a colour.
